

is this a good text to include in my filter instruction: `SCOPE_TABLES: table1 joined by table_base`?

Evaluated filter instruction clarity and identified structural concerns

No — that text isn't well-suited for the filter Instructions field, for a few reasons:

Why it falls short:

1. **Wrong job for this field.** Filter instructions should explain *when and why* to apply the filter (a trigger condition), not which tables to join. Table relationships belong in **Join Relationships** (Configure > Data > Joins), and which tables/columns to use is the job of **table descriptions**, not filter instructions.
2. **It's not natural language.** Genie's instruction fields are meant to be parsed as plain-language guidance, similar to briefing a new analyst. Cryptic key-value shorthand like `SCOPE_TABLES: table1 joined by table_base` isn't the pattern Genie is designed to interpret — it reads more like pseudo-config than an instruction.
3. **It doesn't say when to use the filter.** The core purpose of this field is to answer "under what circumstances should Genie apply this filter?" — e.g., in response to which business terms or phrasing. Your text doesn't address that at all.

What to put there instead, for example:

"Apply this filter when the user asks about [business term, e.g., 'active accounts' or 'recent orders']."

Where the join info should actually go:

- If `table1` needs to be joined to `table_base` for this filter to resolve correctly, define that relationship explicitly under **Join Relationships**, so Genie knows the join path independent of any one filter.
- If the filter's SQL itself needs to reference the joined table, that belongs in the **Code** field (the actual SQL), not the Instructions field.
